

LIFEBOOK
App Flow
LifeBook

The current, implemented — and currently unmeasured — user journey

Prepared by LifeBook Inc. • Version 4.0 • September 2026

Every flow below is implemented and functions correctly end-to-end in testing. None of it is currently instrumented with analytics, so real drop-off points, hesitation, or confusion are invisible until basic event tracking is added (see TRD, section 4).

1. Identity & onboarding

Step	What happens
1	App launch → Firebase configured? → Login/Sign-up; else → anonymous local id
2	First-time user → 7-step onboarding
3	Returning user → Home

2. Daily check-in flow

Step	What happens
1	User picks one of six moods on Home
2	Orchestrator: retrieval → generation → safety review
3	Guided flow: Scripture → Reflect (optional, saves to journal) → Meditate (2/5/10 min) → Pray (guided or written) → Completion
4	Streak and badges update

3. Journey flow

Step	What happens
1	Home shows "Continue Your Journey" or a mood-matched recommendation with a real reason
2	Starting creates a progress record at day 1
3	Continuing feeds that day into the same guided flow used for check-ins
4	Completing the flow advances the day, or completes the journey on the final day

4. Community flow

Step	What happens
1	Prayer requests and discussions pass through moderation before appearing publicly
2	Spam is rejected; distress language is approved but flagged with a support note

5. What this flow map cannot show you

A flow diagram shows the paths that exist. It cannot show which paths people actually take, where they hesitate, or where they quietly close the app. That data does not exist yet for LifeBook. It will not exist until real users are recruited and basic analytics are in place — both flagged as the immediate next steps in the Implementation Plan.
