**Product Requirements Document**

# **LifeBook**

*Final revision — honest about what is built vs. what is validated*

Prepared by LifeBook Inc. • Version 4.0 • September 2026

## 1. Vision & mission

LifeBook is an AI-native Christian wellness platform that meets people in their actual spiritual state and walks them into scripture, guided reflection, meditation, prayer, and community.

*This document is deliberately honest about a distinction the earlier revisions blurred: a feature being built and tested by automated checks is not the same as a feature being validated by a real person. Every feature below has the former. None has the latter yet.*

## 2. Validation status — read this before anything else

As of this revision, zero real users have opened this app. Every product decision — the mood set (redesigned three times), the guided flow, the journeys, the navigation structure — was reasoned from research, UX literature, or internal review, not from a person tapping through it and reacting. That is a materially weaker form of evidence than user testing, and it should not be mistaken for validation.

| Decision                                                               | Basis so far                                      | Still needs                                                                                                 |
|------------------------------------------------------------------------|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| 6-mood set (Grateful, Peaceful, Seeking, Doubting, Distant, Convicted) | LifeWay Research, Barna Group, Ignatian tradition | Whether a real user recognizes these words as describing their own state, or finds them clinical/unfamiliar |
| 5-tab navigation (Home/Explore/Practice/Community/Profile)             | A single external UX audit document               | Whether people can actually find Journeys, Library, and Progress without being told where they moved        |
| Guided 5-step flow (Scripture→Reflect→Meditate→Pray→Complete)          | Internal design reasoning                         | Completion rate and drop-off point — currently not even instrumented (see Backend Schema, section 6)        |
| 3 authored journeys                                                    | Original writing, no external review              | Whether the reflection/prayer tone lands as intended across denominational backgrounds                      |

*The single highest-priority action in this document is Section 2 of the Implementation Plan: recruit 5-10 real users this week. The app runs with zero setup in dev-fallback mode — there is no technical blocker to doing this immediately.*

## 3. Goals

- Validate — with real people, not internal reasoning — that the mood framework and guided flow actually resonate before investing further in infrastructure.
- Deliver daily spiritual content that reflects a researched faith-journey state, once confirmed that framing lands.
- Build a content and theological review pipeline that scales without scaling risk — contingent on actually staffing a reviewer (see section 6).
- Give users a structured, multi-day way to grow (Journeys).
- Build genuine community and, eventually, a sustainable premium tier.

## 4. Success metrics

| Metric                                    | Target                                                                    | Status                                                                     |
|-------------------------------------------|---------------------------------------------------------------------------|----------------------------------------------------------------------------|
| Real users who have opened the app        | $\geq 5$ , this week                                                      | Currently zero — this is the metric that gates everything else             |
| Day-7 return rate among first test cohort | $\geq 30\%$                                                               | Not measurable yet — no cohort exists                                      |
| Guided flow completion rate               | $\geq 80\%$                                                               | Not measurable yet — not instrumented (no analytics events currently fire) |
| Content flag rate                         | Under 2%                                                                  | Only tested with synthetic/developer-generated check-ins, not real usage   |
| Mood-word comprehension                   | Qualitative — do testers recognize the 6 mood labels without explanation? | Not tested                                                                 |

## 5. Feature set — built vs. validated

| Feature                                             | Engineering status                                      | Validation status                                              |
|-----------------------------------------------------|---------------------------------------------------------|----------------------------------------------------------------|
| Onboarding (7 steps)                                | Built and tested                                        | Never seen by a real first-time user                           |
| 6-mood check-in → AI content                        | Built and tested end-to-end                             | Mood words themselves unvalidated                              |
| Guided 5-step flow                                  | Built and tested                                        | Completion/drop-off unmeasured — not instrumented              |
| Journeys + mood-based recommendation                | Built and tested end-to-end                             | Content tone unreviewed by anyone but the builder              |
| Community (groups, prayer, discussions, moderation) | Built and tested against synthetic spam/distress inputs | Never tested against real community dynamics                   |
| Library                                             | Built and tested                                        | Untested; 4 of 6 books have no real text pending licensing     |
| Real Firebase Auth                                  | Code written, dev-fallback path tested                  | Live path never run against a real project                     |
| Push notifications                                  | Token handling tested                                   | Actual delivery never observed                                 |
| Deployment (Docker + Render Blueprint)              | Locally verified                                        | Never deployed to a live URL                                   |
| Security (CORS, rate limiting)                      | Built and tested against real requests                  | Never tested under real adversarial or high-traffic conditions |

## 6. The one risk that has not moved across every revision of this document

---

A named, staffed human theological reviewer for the content flag queue has been identified as necessary since the very first review of the original business plan, and remains unresolved. This is not a code gap — the flag queue works. It is a hiring decision that has been easy to defer in favor of more visible engineering progress. It should be treated as a blocker to any real user beyond a small, known, consenting test group.

## 7. Risks & mitigations

---

| Risk                                             | Mitigation                                                                                                         |
|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Shipping unvalidated product decisions at scale  | Small real-user test (5-10 people) before any further feature work — see Implementation Plan                       |
| AI misinterpretation of scripture or context     | Retrieval-grounded verse selection, automated review agent, human review queue — queue has no staffed reviewer yet |
| Content sensitivity across denominations         | System prompt instructs pastoral, non-shaming framing; unreviewed by an actual theologian                          |
| Platform abuse / runaway AI spend                | Rate limiting is live and tested                                                                                   |
| Building further before validating the core loop | This document's own recommendation: stop and test before adding scope                                              |
